

PDF page range practice

Use this document to practice saving only the pages you want. It contains two pages of content followed by an intentionally blank third page. Keep pages 1 and 2 when creating your practice PDF.

Your practice task

Open this file in Google Docs using Edge on Windows. Check the page count and preview before saving. Create a separate PDF that contains only pages 1 through 2, then reopen that PDF to inspect the result.

What to keep

The title on this page, the checklist on page 2, and the green header bands should appear in the exported PDF. The final blank page should be absent.

A link to check

The link below gives you an easy way to check whether the exported PDF keeps a working hyperlink. You can inspect its destination before opening it.

[Visit the HWANSEEK blog](#)

This file is for practice. Saving selected pages creates a separate PDF; it does not delete pages from your original document.

PDF export checklist

After saving your PDF, compare it with these checks. Use the PDF you just created, rather than an older copy with a similar name.

Check the page count

The practice PDF should contain two pages. This checklist should be its last page. Scroll past the bottom to make sure there is no extra blank page.

Check the visible content

Both page titles should be readable. The green bands should appear above the content. No paragraph should be cut off at the bottom or pushed outside the page.

Check the hyperlink

Return to page 1 and inspect the blog link. Its destination should be <https://hwanseek.blogspot.com/>. A PDF viewer may request confirmation before opening an external website.

Keep the original file

The original document will still include the third page. That is expected for this exercise. If you need to repair a real document, diagnose its page or section breaks separately.

Practice complete

Keep your original document and the saved PDF so you can repeat the exercise. Give the PDF a clear name such as selected-pages-1-2.pdf.
